

Assignment (Session – 6)

Theory Type :

- 1.) Define left shift (<<) operator with an example.
- 2.) Define right shift (>>) operator with an example.
- 3.) What happens to a number when it is left shifted by 1 position?
- 4.) What happens to a number when it is right shifted by 1 position?
- 5.) Write the difference between if-else and switch case.

Coding Type :

- 1.) Write a C program using a **switch case** statement that accepts a number from the user (1–7) and displays the corresponding day of the week.

1 → Monday
2 → Tuesday
3 → Wednesday
4 → Thursday
5 → Friday
6 → Saturday
7 → Sunday

If the user enters a number other than 1–7, display **"Invalid input"**.

```
Sample Input:

css

Enter a number from 1 to 7 : 5

Sample Output:

mathematica

Friday
```

```
Sample Input 3:

css

Enter a number from 1 to 7 : 7

Sample Output 3:

mathematica

Sunday
```

```
Sample Input 4 (Invalid Case):

css

Enter a number from 1 to 7 : 9

Sample Output 4:

css

Invalid input
```

2.) Write a C program that takes an integer number and a shift value from the user. The program should display:

- The original number
- The number after performing **left shift** by the given shift value
- The number after performing **right shift** by the given shift value

Sample Input:

yaml

Enter a number : 10

Enter shift value : 2

Sample Output:

yaml

Original number : 10

After left shift : 40

After right shift : 2
